

➔ OVERWHELMED?

Weeks of Work Cut Down to Seconds with Lieberman Software's Industrial Strength Windows Systems Management Tools

Lieberman Software's administration tools give experienced Windows administrators the power they need.

Are your users installing unauthorized software, being infected by viruses, adding shares that should not be there, and generating an unending list of other problems? Do you need to stay in compliance with Federal and State regulatory requirements (regular password changes, auditing, etc.)? We understand why this can leave you feeling totally overwhelmed.

Most administrators try to get out of this mess by using Active Directory's Group Policies, coupled with writing scripts. But, after trying this approach for a while, they discover that they are clueless as to what is really happening in their environment, and have to write scripts to do anything really useful. Why should you have to write script after script to handle the same issues that every administrator faces? Our tools get you out of the script writing business and give you the management capabilities you need.

Task Scheduler Pro™ Mass manage change and reporting of scheduled tasks in Windows

See and manage all scheduled tasks on all systems in a single consolidated view. Features include quick job creation, granular job property editing, AT account management, job copy and paste, remote log viewing, and push/run of supporting files and jobs.

COM+ Manager™ A change and reporting tool for COM+/MTS/DCOM components

Regulatory requirements to regularly change domain administrator account credentials referenced by N-Tier components are often ignored because it is impossible to find and change all the references manually. COM+ Manager allows you to see and change identity information on all your MTS, COM+ and DCOM components on all your systems.

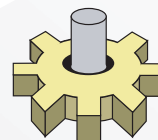

User Manager Pro™ Mass manage local security on all of your workstations and servers

Report on a vast number of internal settings of all your systems including: accounts, memberships, groups, rights, auditing, files, shares and more. Change any of these settings and more, across all of your systems. The management capabilities are vastly more sophisticated than anything in Group Policies or anything you could code with a VB script. All operations are fully audited, with scheduling and auto-retry built-in. Full remote desktop management with built-in VNC and Terminal Server support.

Random Password Generator™ Add-on module for User Manager Pro

Use this optional add-on module to give each system's administrator account a unique cryptographically complex password. All assigned passwords can be automatically stored in a redundant, encrypted and password controlled database. The stored passwords can be retrieved by authorized users via the User Manager Pro program or via our Web Access Component.

Service Account Manager™ Mass manage services on all your machines in a single view

Service Account Manager is a sophisticated tool for reporting on, and changing service account credential usage on all your systems. It handles complex service dependencies, rights and group memberships, logon cache management, impersonation and more. All operations are audited in detail. Built-in scheduling and auto-retry handle off-line systems with ease. Full remote desktop management with built-in VNC and Terminal Server support.
