

USER MANAGER PRO

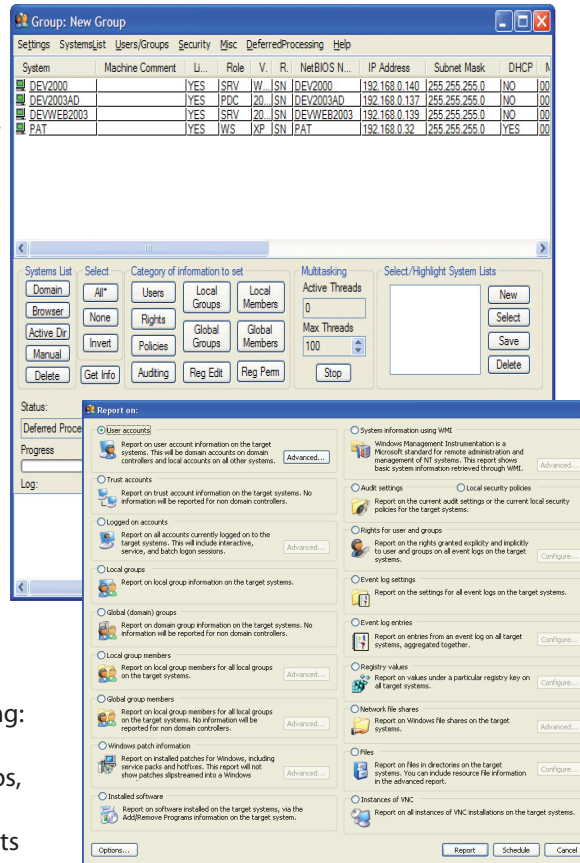

User Manager Pro enables system administrators to report on and make global security changes to user credentials, group memberships, files, registry settings and more. This **multi-threaded** solution operates **without** the use of agents and allows administrators the ability to manage hundreds to thousands of machines in seconds to minutes from a single console.

User Manager Pro rapidly mass manages security settings on servers & workstations

Problem: Microsoft's built-in tools force administrators to perform operations manually, one machine at a time, eating up expensive IT resources. Common tasks, such as regularly changing the local administrator account name and password on all managed workstations and servers are ignored and massive security holes are formed.

Solution: With User Manager Pro, it is a simple process to mass manage these changes. All an administrator needs to do is highlight the list of machines to change, bring up the appropriate category of change, fill in the settings and click "Apply." In a few moments changes such as these can be made to every machine in the environment:

- Add/update/delete local accounts
- Add/update/delete local/global groups
- Change local/global group memberships
- Change audit settings
- Reboot, abort reboot, send message
- Edit registry keys/values/permissions
- Report on a variety of system information, including:
 - Local users, groups, group memberships
 - Domain users, groups, group memberships, trust accounts
 - Local security settings, audit settings, rights
 - Registry keys/values
 - Windows Service Packs and patches

Key Mass Management Features

- ➔ Logs activities with immediate confirmation of success and failure.
- ➔ Record audit trail entries for each event with time and date stamp.
- ➔ Add/update/delete local /global groups.

Latest Features

- NEW!** Complete WMI reporting to get information on any aspect of your systems such as running processes or device inventory.
- NEW!** Consolidated reporting on all shares and their permissions within your network. Selectively edit permissions and remove all unwanted shares.
- NEW!** Improved event log reporting to include filtering and reduce the amount of useless information.
- NEW!** Schedule and store interactive reports in a SQL/MSDE database for later review and action.

User Manager Pro Interactive Reporting Features

- ➔ Local and Domain users including Active Directory attributes
- ➔ Local and Domain groups and group memberships
- ➔ Local security settings, audit settings, rights registry keys and values
- ➔ Windows and Internet Explorer Service Packs and Hotfixes
- ➔ Windows Event Log settings and entries
- ➔ Logged on accounts
- ➔ Installed software
- ➔ Windows File Shares/Permissions
- ➔ Files in directories
- ➔ VNC installations
- ➔ Store and email reports

Mass manage local security on all of your workstations and servers

With User Manager Pro, you can report on a vast number of internal settings on all your systems including: accounts, memberships, groups, rights, auditing, files, shares and more. You can also change any of these settings and more across all of your systems.

The management capabilities are vastly more sophisticated than anything in Group Policies or anything you could code with a VB script.

All operations are fully audited with scheduling and auto-retry built-in. Full remote desktop management with built-in VNC and Terminal Server support.
