

USER MANAGER PRO ADD-ONS

RANDOM PASSWORD GENERATOR

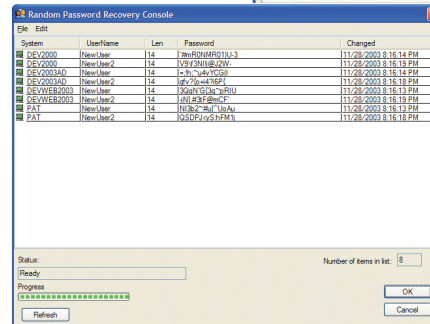

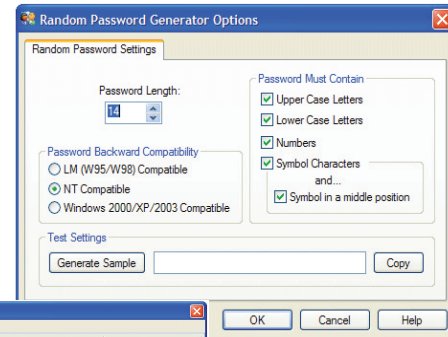

in coordination with User Manager Pro, automatically updates every built-in administrator account with a unique complex password.

Random Password Generator stores all passwords in a password-protected database. An administrator can easily retrieve them if he/she needs to use the built-in administrator account to gain access to a system that would otherwise be inaccessible.

Most administrators configure all of their workstations with the same built-in administrator account name and password. This practice creates a huge vulnerability where a malicious individual could discover the common password, log on to one system locally with the account, and have administrative access to every other system with the same common administrator name and password - perhaps even all computers in the organization.

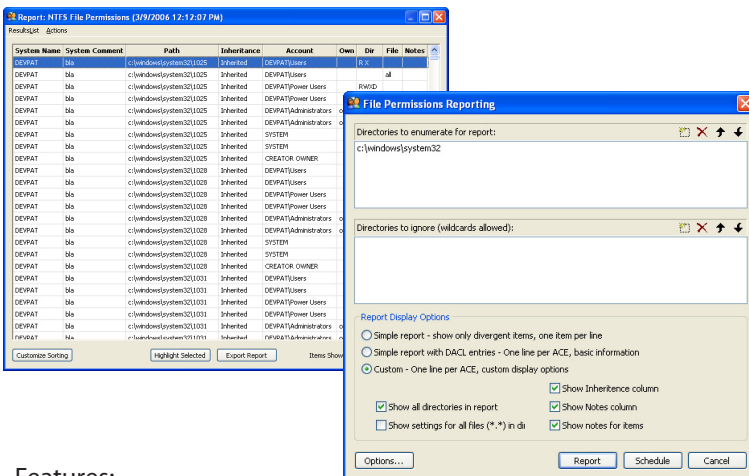

Random Password Generator, in coordination with User Manager Pro, simplifies this process, giving an administrator the ability to schedule account updates on every system and set the built-in administrator account's passwords in compliance with their organization's security policy.

The generated random passwords use letters, numbers and punctuation. Passwords can have up to 14 characters for Windows NT and up to 127 characters for Windows 2000 and higher. This complexity, combined with scheduled password changes on a frequent basis, makes brute force cracking of the accounts infeasible.

NTFS PERMISSIONS REPORTING

allows administrators to view which accounts have access to which files and folders in a single view from multiple machines.

Features:

Get a consolidated view of all permissions of all files and all folders across all systems.

Create a customized report showing who has access to what files and what folders.

Edit permissions to files and folders to guarantee correct access. This feature will help you maintain all government regulatory requirements.

PASSWORD RECOVERY CONSOLE

enables web based access to passwords stored by User Manager Pro.

Password Recovery Console provides you with the ability to search for and retrieve the current local built-in administrator passwords (you control which machine passwords are stored for retrieval) for any of your systems managed by User Manager Pro.

Password Recovery Console allows any authorized user with a web browser to retrieve the last refreshed status of your workstations managed by User Manager Pro.

This add-on is ideal for help desks that need to obtain the status and credentials necessary to boot a system in Safe Mode.

Features:

Control granted by Domain Administrators to a group of users to allow that group the ability to recover passwords set by User Manager Pro with Random Password Generator for a group of systems that exist in User Manager Pro.

Enable administrators to assign responsibility for recovery of particular accounts or groups of accounts to appropriate employees.

Delegate the recovery of passwords with a Web Console while providing a comprehensive audit trail.
