

USER MANAGER PRO SPOTLIGHT FEATURE: DELEGATED WEB REPORTING

Web Reporting for User Manager Pro allows all reports to be viewed through a delegated and audited web interface. This ensures that only the appropriate staff has access to the information they need.

ENHANCING YOUR UMP EXPERIENCE

Using the web site makes the information available to any authorized person in the network.

The reports that are generated by UMP can be very large. When UMP generates a report and exports it to an html format, that file may be 40MB or considerably larger. 40MB is almost unreasonable for Internet Explorer to load and display. Web Reporting for UMP has no such limitations because it can paginate the report.

The reports exported by UMP cannot be sorted nor can they filter the view once they are generated. Also, the reports would be accessible to all; you could not delegate access to specific reports.

KNOWLEDGE IS KEY

If I know what patches have been applied to a server or workstation, I also know what has not been applied and thus know what some of the inherent weaknesses of the system will be. If I know what software is installed on a system, I know how to exploit that software to break. If I know what the auditing settings of a computer are, I can identify a weaker target in the network to start my point of break in. If I have a list of user accounts, I have a list I can sell to hackers who may use this information in social engineering attacks or worse. The point is, *knowledge is key*. If the wrong people know about the internal workings of your network, there really are no limitations to what they can do.

Since Web reporting for UMP provides delegation and will audit all access into the tool, you have a way to provide security to the information and you have a way of tracking access to the information.
